RANK-REVERSAL-AWARE CALIBRATION, AS USED BY A DECISION MAKER
Inputs
evaluations
weights or order
tolerance $\bar{\Delta}$
1
Diagnose
measure the conflict of the elicited model
2
Explore
NSGA-II trades conflict against deviation
budgets
optima
3
Certify
exact MILP proves optimal weights where tractable
4
Select
least conflict within $\bar{\Delta}$, or the knee
Output
calibrated ranking and decision report
EVALUATION ONLY
not part of the method
new alternatives
literature baselines
random elicited models
scaling and run time
